

# Why and How to Start Planning for Offshore Wind Transmission

## Reducing Costs and Community & Environmental Impacts

PRESENTED BY

Johannes Pfeifenberger

PRESENTED AT

Advanced Energy Institute --  
Eastern Commissioners Forum on  
Offshore Wind Transmission

MARCH 17, 2023

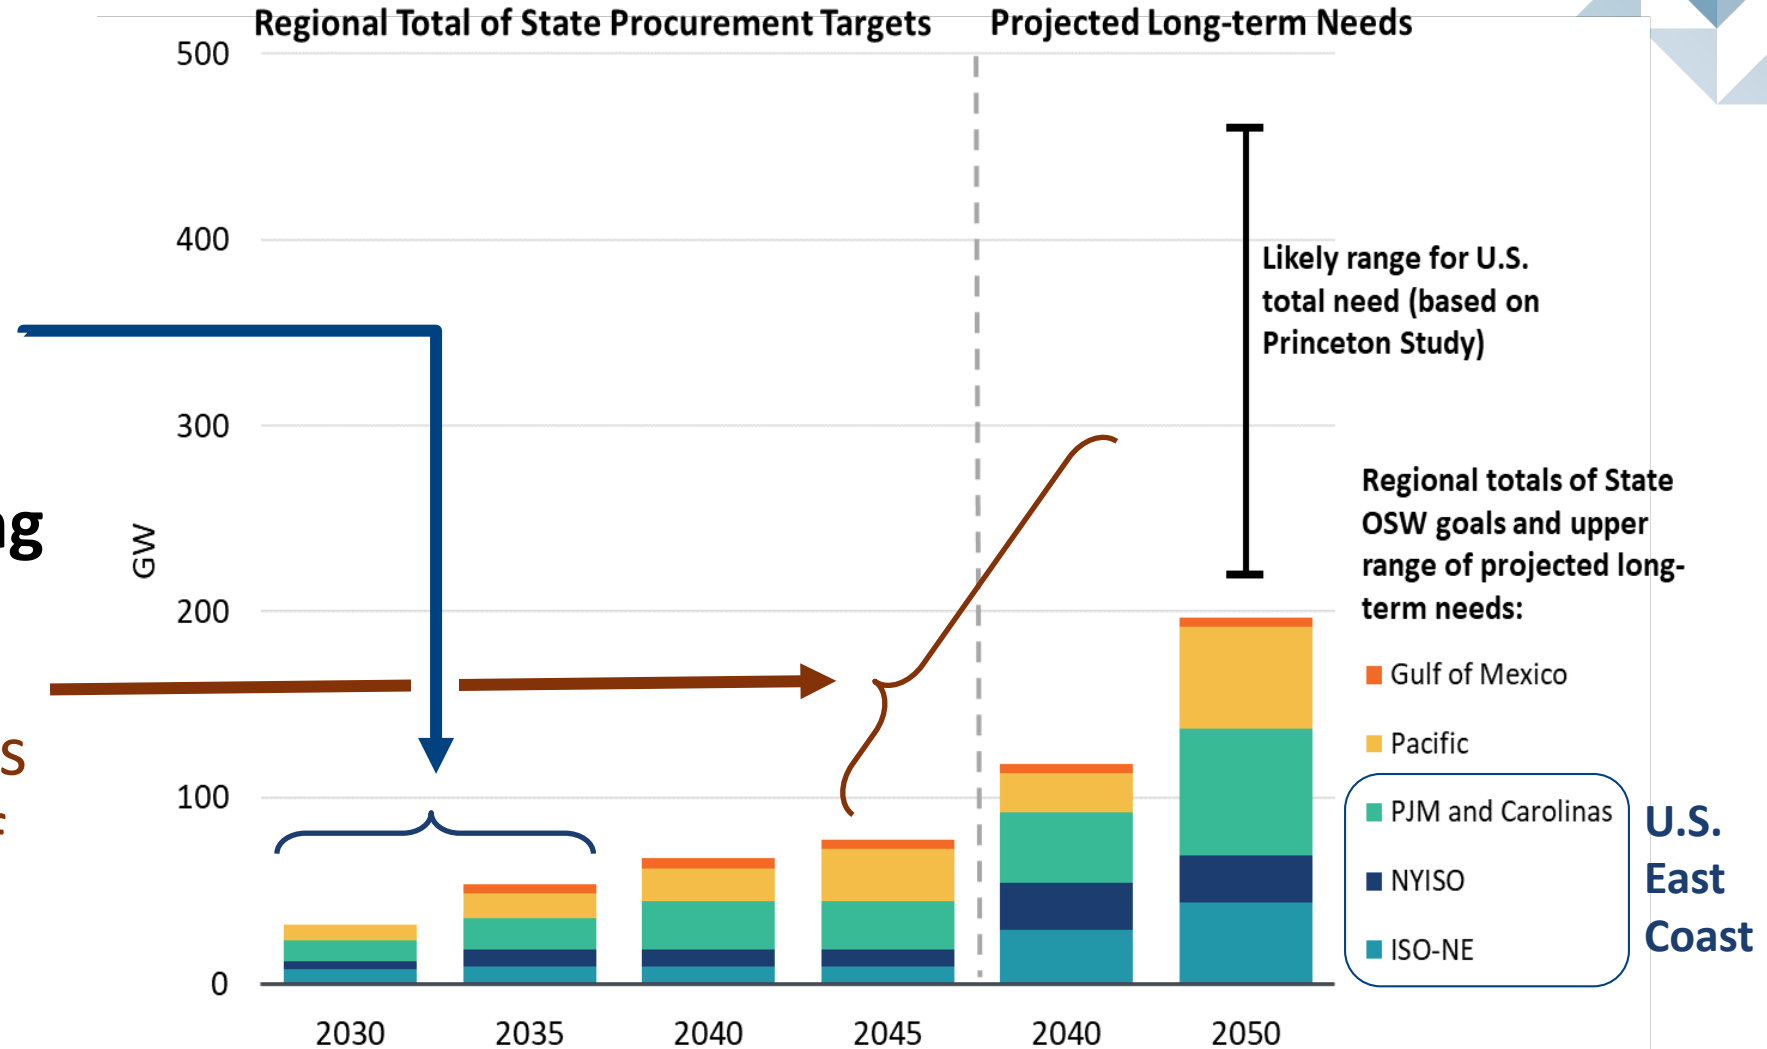

# The Urgency of Starting to Plan for OSW Transmission Now

**We need to urgently plan transmission**

1. for 30-50 GW of OSW by 2030-35

**while also considering**

2. the much higher longer-term needs of 200-450 GW of OSW by 2050

Note: most of the OSW generation will need to be delivered to shore; some may be used to produce hydrogen

# What is Transmission Planning for Offshore Wind?

Transmission planning for OSW generation needs to focus on three elements to reduce total OSW costs and its environmental/community impacts:

1. Where are the best points of interconnection (POIs) for OSW generation that reduce the need for expensive new onshore transmission and upgrades to the existing grid?
2. How can marine cable miles and shoreline impacts be reduced (e.g., high-capacity lines and transmission corridors for cables of multiple OSW plants)?
3. Can submarine cables be networked offshore to reduce costs and reinforce the existing grid?

## Offshore transmission concepts:

### Radial Tie Lines

Transmission links bundled with individual OSW plants

Prevailing approach

### Meshed Generation Ties

Individual lines to shore linked through offshore transmission

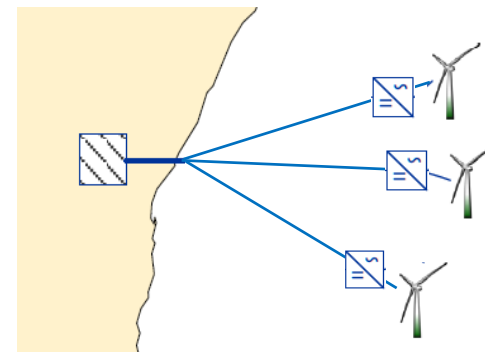

### Offshore Collector

Planned tie line for multiple OSW plants

### Onshore Collector

Onshore POI and corridor for multiple OSW plants

NJ SAA result

### Backbone Offshore Grid

Planned transmission tie lines for multiple OSW plants

# The Benefits of Proactively-Planned OSW Transmission

## Numerous studies document the benefits of starting proactive planning now

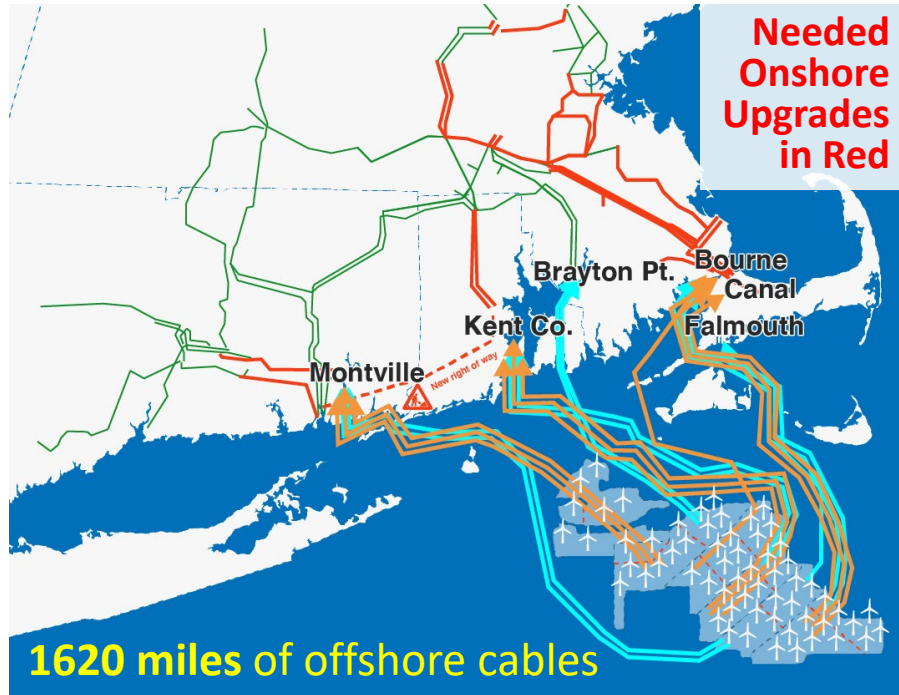

- Choices of POIs, transmission corridors, technology to address 2030 needs will have long-term repercussions, possibly foreclosing attractive options to address longer-term needs

## Based on studies and experience (such as in NJ), proactive planning for 100 GW of additional U.S. OSW generation by 2040-50 can:

- Reduce overall transmission costs by at least \$20 billion
- Result in 60-70% fewer shore crossings and necessary onshore transmission upgrades
- Reduce marine transmission cable installations by 50% or approx. 2,000 miles
- Significantly accelerate achievement of OSW development timelines by:
  - Eliminating interconnection and transmission-related delays
  - Reducing project-development and cost-escalation risks
  - Reducing environmental and community impacts
  - Achieving more competitive procurement outcomes
  - Facilitating investments in the local clean energy economy

# Example: Planned Regional Offshore Transmission (for 8,400 MW total OSW in New England)

Plausible AC Gen-Tie Approach

Planned HVDC+POI Approach

1. Higher-capacity HVDC lines: can reach better POIs and **reduce by 50-70% the impacts on existing ocean uses and marine/coastal environments**

2. Proactively-planned POIs: **reduce onshore upgrades by 60-70%** compared to continued reliance on current, incremental generation interconnection process

3. Opportunities for linking offshore platforms: to create networks that increase reliability and reinforce the onshore grid

# Additional Benefits of Networked Offshore Transmission

**Using standardized, modular offshore transmission facilities that can be networked into an offshore transmission system and integrated with the onshore grid offers important additional advantages:**

- Improve the reliability and value of OSW generation deliveries
- Allow for the utilization of new, higher-capacity transmission cables (each able to deliver 2–2.6 GW of OSW), which further reduces costs and impacts to communities and the environment
- Improve the utilization and flexibility of the offshore transmission infrastructure
- Reinforce and avoid upgrades of existing onshore grids, which will improve grid-wide reliability and reduce future congestion costs
- Create unique, cost-effective opportunities to add valuable interregional transmission links (e.g., addressing constraints into New York City), that increase grid resilience and reduce system-wide costs

# Challenges to Achieving Well-Planned Transmission Solutions

## Grid Planning Processes

1. Slow and costly generator interconnection processes
2. Siloed regional grid planning processes that fail to identify cost-effective solutions for multiple needs
3. The absence of effective planning processes for interregional transmission.

## Regulations, Contracts, & Operations

4. Uncertain federal investment tax credits for offshore wind delivery facilities
5. Undefined regulatory and contractual frameworks for the shared and networked offshore transmission
6. Grid operations not yet capable to optimize use of HVDC links
7. Unclear BOEM permitting for unbundled offshore transmission
8. Uncoordinated processes for lease-area auctions, state procurement, and transmission planning

## Technology

9. Lack of HVDC technology standardization and slow adoption of HVDC in the U.S.
10. The lack of a compelling benefits case for specific meshed offshore grid designs

# Recommendations to Address the Identified Challenges

## Immediate:

- R1: Increase agency staffing
- R2: Identify and empower multi-state decision-making bodies
- R3: Provide IRS guidance regarding applicability of ITC
- R4: Identify feasible, cost-effective POIs
- R5: Develop network-ready standards
- R6: Clarify and modify BOEM permitting requirements

Federal funding through IRA and IIJA is available now to support necessary planning efforts and implement recommendations

## Next 1-2 years:

- R7: Develop cost allocation framework
- R8: Develop HVDC technology and operational standards
- R9: Improve RTO/ISO regional transmission planning processes

## Next 2-3 years:

- R10: Interregional transmission planning processes

## Next 3-5 years:

- R11: Develop offshore grid contracts and regulations
- R12: Develop grid operations and wholesale market design modifications

2023

2024

2025

2026

2027

# Takeaways

---

1. Starting proactive, collaborative planning for offshore wind transmission now is critical for lowering costs, reducing delays, and mitigating community and environmental impacts
  - Planning for 2030-35 OSW generation has to consider longer-term needs through 2040-50, or more cost effective options will be foreclosed
  - Planning can reduce OSW transmission costs by \$20 billion through 2040, reducing onshore upgrades and community & environmental impact by 60-70%
  - Delaying planning effort by five years, may cut in half cost savings achievable by 2050
2. Significant coordination, planning process, and technology challenges need to be addressed
3. We developed a number recommendations on how to address these challenges
4. Federal funding through IRA and IIJA is available now to support necessary planning efforts and implement recommendations

Thank You!

## OSW DEVELOPMENT PIPELINE AS OF DECEMBER 2022

Status	Description	Total (MW)
Operating	The project is fully operational with all wind turbines generating power to the grid.	42
Under Construction	All permitting processes completed. Wind turbines, substructures, and cables are in the process of being installed. Onshore upgrades are underway.	932
Financial Close	All permitting processes completed. Begins when sponsor announces final investment decision and has signed contracts.	0
Approved	BOEM and other federal agencies reviewed and approved a project's COP. The project has received all necessary state and local permits as well as acquiring an interconnection agreement to inject power to the grid.	0
Permitting	The developer has site control of a lease area, has submitted a COP to BOEM, and BOEM has published a Notice of Intent to prepare an Environmental Impact Statement on the project's COP. If project development occurs in state waters, permitting is initiated with relevant state agencies.	18,581
Site Control	The developer has acquired the right to develop a lease area and has begun surveying the lease area.	24,096
Unleased Wind Energy Area	The rights to a lease area have yet to be auctioned to offshore wind energy developers. Capacity is estimated using a 3 MW/km <sup>2</sup> wind turbine density assumption.	8,290
<b>Total U.S. OSW Pipeline:</b>		<b>51,941</b>

# Newly Available Federal Support

Substantial federal support is available now, but should continue to evolve to more fully meet the funding needs of regional & interregional OSW transmission development

## 1. Inflation Reduction Act:

- **Section 50153:** up to \$100 million is available for funding for planning, modeling, analysis, and convening stakeholders;
- **Section 50152:** up to \$760 million to facilitate the siting of certain interstate and offshore transmission lines;
- **Section 50151:** up to \$2 billion in facility financing, including loan guarantees, to certain transmission facilities designated by Secretary of Energy to be in the national interest;
- **Section 1706:** up to \$250 billion in energy infrastructure reinvestment loan financing, to retool, repower, or repurpose energy infrastructure, including transmission to avoid or reduce greenhouse gases;
- **Section 13502:** includes additional tax credits for domestic manufacturing of offshore wind facilities and vessels.

## 2. Infrastructure Investment and Jobs Act:

- **Section 40101:** up to \$5 billion for resilience grants, including \$2.5 billion for Grid Resilience utility Grants (40101 (d)) for states, tribes, and territories, and \$2.5 billion for Grid Resilience Industry Grants (40101(c)) through competitive grants;
- **Section 40103(b):** up to \$5 billion for the Grid Innovation Program, funding innovative approaches to transmission, storage, and distribution infrastructure;
- **Section 40107:** up to \$3 billion for Smart Grid Grants, enabling deployment of technologies that enhance grid flexibility;
- **Section 40106:** up to \$2.5 billion on a revolving basis for the Transmission Facilitation Program, which allows DOE to engage in various ways (including capacity contracts) to assist in the design, construction, operation of qualifying facilities.

# Studies: Benefits of Proactively-Planned Offshore Transmission

## Cost-Savings, Regional Planning

- PJM's [Offshore Wind Transmission Study](#) for 75 GW of clean energy resources shows a nearly 90% interconnection cost reduction for public policy resources compared with [previous cost analyses](#).
- PJM-New Jersey [State Agreement Approach](#) shows over \$900 million in cost-savings for interconnecting an additional 6,400 MW of OSW, among other benefits.
- MISO-SPP's [Joint Targeted Interconnection Queue Studies](#) reduce interconnection costs by over 50% while reducing other customer costs by approximately \$1 billion.
- MISO's [Long-Range Transmission Planning](#) effort enables 90 GW of new resource interconnections, offering customer savings with total benefits about 3x total costs.
- National Grid's [study](#) for the UK found that proactive planning OSW Transmission through 2050 reduces costs by 19%, along with other benefits. A delay of only 5 years, cuts these benefits in half.

## Cost-Savings, Inter-regional Planning

- LBNL's [recent study](#) found expanding transmission capability between any of the 3 northeastern ISOs by 1,000 MW would have saved \$100-300 million per year in wholesale power purchases, expected to grow with time.
- LBNL [also identified](#) resilience benefits, based on a large amount of interregional transmission value occurring during difficult-to-forecast times of severe system stress.
- MIT's [recent study](#) of the Northeastern U.S. and Canada found that an additional 4 GW of transmission capacity to Quebec could lower costs of zero-emissions power systems by 17-28%.
- A recent [national study](#) by MIT found for deeply-decarbonized systems interregional transmission could reduce total generation and transmission costs by up to 20%.
- A recent [General Electric Study for NRDC](#) showed that expanding interregional transmission capacity by 87 GW between various regions would provide \$83 billion in customer benefits.

# Studies: Benefits of Proactively-Planned Offshore Transmission

## Environmental & Community Benefits

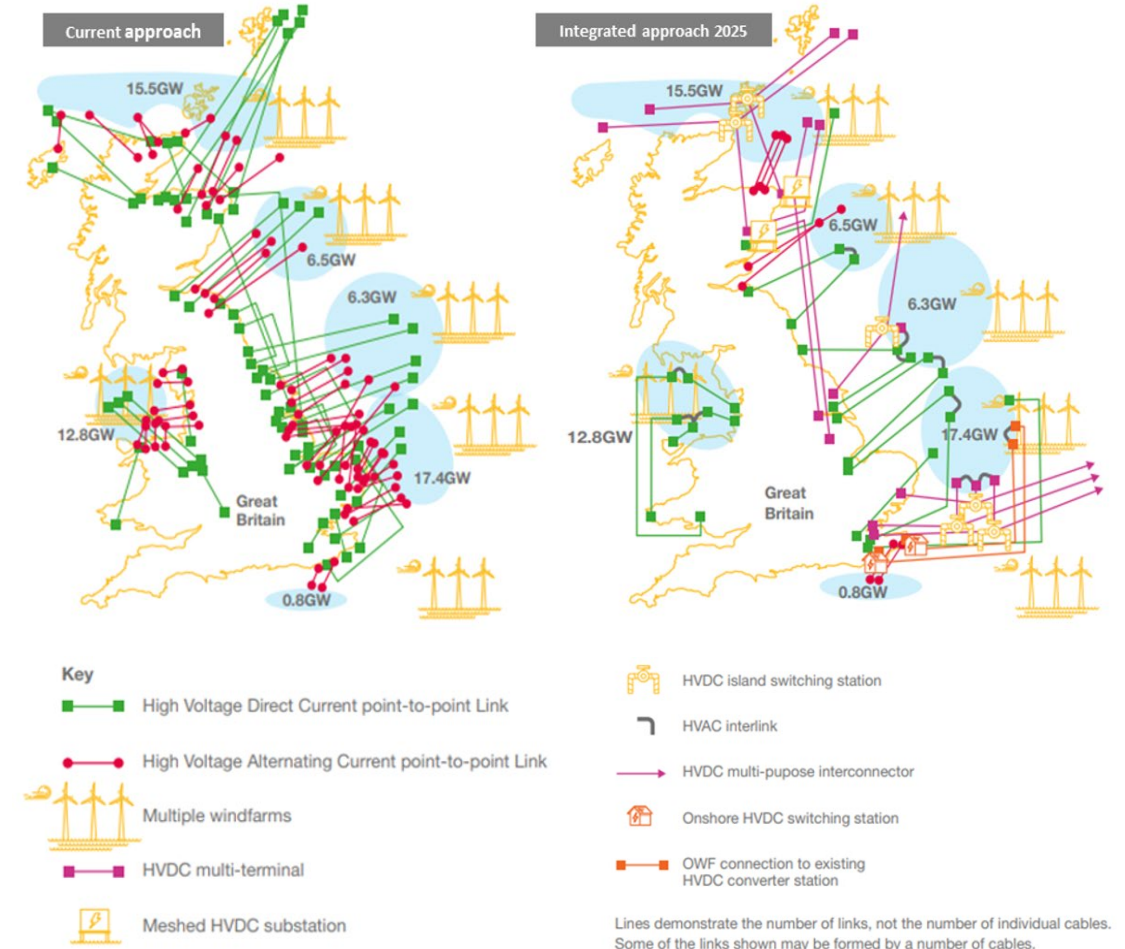

- National Grid [found](#) that proactive planning for U.K.'s 2050 OSW goal significantly reduced marine and shoreline impacts, with 70% fewer beach crossings, and 30% lower offshore line-miles. The study similarly found reduced onshore impacts, with proactive planning requiring 60% fewer onshore line miles, and 55% less land.
- Similar benefits have been [demonstrated](#) by Brattle and Anbaric for New England and NY
- The magnitude of these benefits is confirmed by New Jersey's experience with the [State Agreement Approach](#), which allowed the consolidation of onshore grid access into a single transmission corridor, reducing onshore environmental and community impacts by two-thirds.

## Employment Benefits

- Extrapolating from [Clean Energy State Alliance](#) projections, onshoring supply-chains to meet current goals could provide 135,000 jobs.
- The [American Wind Energy Association](#) has forecasted 20-30 GW of OSW will support between 45,000-83,000 American jobs by 2030.
- Similar estimates from [American Clean Power](#) estimate 23-40 GW OSW will result in 73,000-128,000 direct jobs.

UNPLANNED VS. PLANNED TRANSMISSION FOR U.K. OFFSHORE WIND IN 2050  
(Assuming planning efforts start to be effective by 2025)

Source: National Grid ESO, [Offshore Coordination Phase 1 Report](#), December 2020.

# Implement Pragmatic Cost Allocations

**New, less-contentious cost-allocation approaches are needed to achieve efficient OSW transmission solutions. More cost-effective solutions will facilitate cost allocation!**

- Reduce generator responsibility for distant network upgrades identified through today's generation interconnection process
  - Focus generator allocations initially on upgrades needed locally for non-firm interconnection rights
- Address network upgrades through transmission planning process, with cost allocation that roughly reflects beneficiaries
  - If network upgrades are mostly driven by states' public policy needs, consider allocating costs to the respective states (in exchange for clean-energy interconnection rights)
  - Without clean-energy interconnection rights, consider allocating costs to benefitting loads and, pro-rata, to interconnecting generators (similar to CAISO's Tehachapi approach and SPP-MISO's JTIQ)
- Implement portfolio-based (not project-specific) cost allocations
  - Less controversial and easier to implement because portfolio-wide benefits tend to be more even distributed and more stable over time

**Avoid cost allocations that are strictly based on quantified benefits (which change over time, and across scenario assumptions and benefit metrics)**

# Recommendations for Addressing the Identified Challenges

**Immediate Actions: to ensure that some challenges can be addressed expeditiously in states' OSW generation and transmission procurements**

- 1. Increase staffing at state and federal regulatory agencies involved in OSW planning**
  - *Relevant entities: state governors or senior policymakers, federal policymakers*
- 2. Create and empower multi-state decision-making entities**
  - *Relevant entities: state governors or senior policymakers and state regulatory agencies with support of grid operators, DOE, FERC, BOEM, industry stakeholders*
- 3. Provide IRS guidance regarding applicability of ITC to offshore interconnection facilities**
  - *Relevant entities: IRS*
- 4. Identify feasible POIs to cost-effectively accommodate identified OSW needs over time**
  - *Relevant entities: states, multi-state entities, DOE, grid operators, FERC*
- 5. Develop network-ready standards for offshore facilities that can be linked to create offshore grid**
  - *Relevant entities: DOE, states, grid operators with input from OSW generation and transmission developers*
- 6. Clarify and modify BOEM transmission permitting and lease-process coordination**
  - *Relevant entities: BOEM, DOE, OSW transmission developers*

# Recommendations for Addressing the Identified Challenges

## Near-Term Actions (1-2 years)

7. **Develop multi-state cost-allocation framework**
  - *Relevant entities: state regulatory agencies, grid operators, FERC*
8. **Develop HVDC-technology and operational standards**
  - *Relevant entities: DOE, grid operators, states*
9. **Improve regional transmission planning processes (ongoing)**
  - *Relevant entities: FERC, grid operators*

## Mid-Term Actions (2-3 years)

10. **Create effective interregional transmission planning processes**
  - *Relevant entities: FERC, grid operators, multi-state entities with input from market participants*

## Longer-Term Actions (3-5 years)

11. **Develop offshore grid contracts and regulations for shared-use and open-access facilities**
  - *Relevant entities: DOE, FERC, states, multi-state entities, ISOs/RTOs, with input from OSW generation and transmission developers*
12. **Develop grid operations and wholesale market design modifications**
  - *Relevant entities: DOE, FERC, grid operators, transmission owners*

# About the Speaker

BOSTON**

[Hannes.pfeifenberger@brattle.com](mailto:Hannes.pfeifenberger@brattle.com)

+1.617.234.5624

**Johannes (Hannes) Pfeifenberger**, a Principal at The Brattle Group, is an economist with a background in electrical engineering and over twenty-five years of experience in wholesale power market design, renewable energy, electricity storage, and transmission. He also is a Visiting Scholar at MIT’s Center for Energy and Environmental Policy Research (CEEPR), a Senior Fellow at Boston University’s Institute of Sustainable Energy (BU-ISE), a IEEE Senior Member, and currently serves as an advisor to research initiatives by the U.S. Department of Energy, the National Labs, and the Energy Systems Integration Group (ESIG).

Hannes specializes in wholesale power markets and transmission. He has analyzed transmission needs, transmission benefits and costs, transmission cost allocations, and renewable generation interconnection challenges for independent system operators, transmission companies, generation developers, public power companies, industry groups, and regulatory agencies across North America. He has worked on transmission matters in SPP, MISO, PJM, New York, New England, ERCOT, CAISO, WECC, and Canada and has analyzed offshore-wind transmission challenges in New York, New England, and New Jersey.

He received an M.A. in Economics and Finance from Brandeis University’s International Business School and an M.S. and B.S. (“Diplom Ingenieur”) in Power Engineering and Energy Economics from the University of Technology in Vienna, Austria.
